

If you are worried about having an MRI scan and would like to talk to someone, you can contact:

- Your doctor
- Your local Learning Disabilities Team

Having an MRI scan

This leaflet explains what happens when you go to hospital for an MRI scan.

Produced by Michelle Forster, Marianne Duffy and Sally Poole on behalf of the Access to Health Project and The Community Healthcare Team, Islington Learning Disabilities Partnership, with help from the radiography department at the Whittington Hospital.

Illustrated by Sally Poole.

An MRI scan is a special photograph of the inside of any part of your body.

It can show the doctor if there is anything wrong with you.

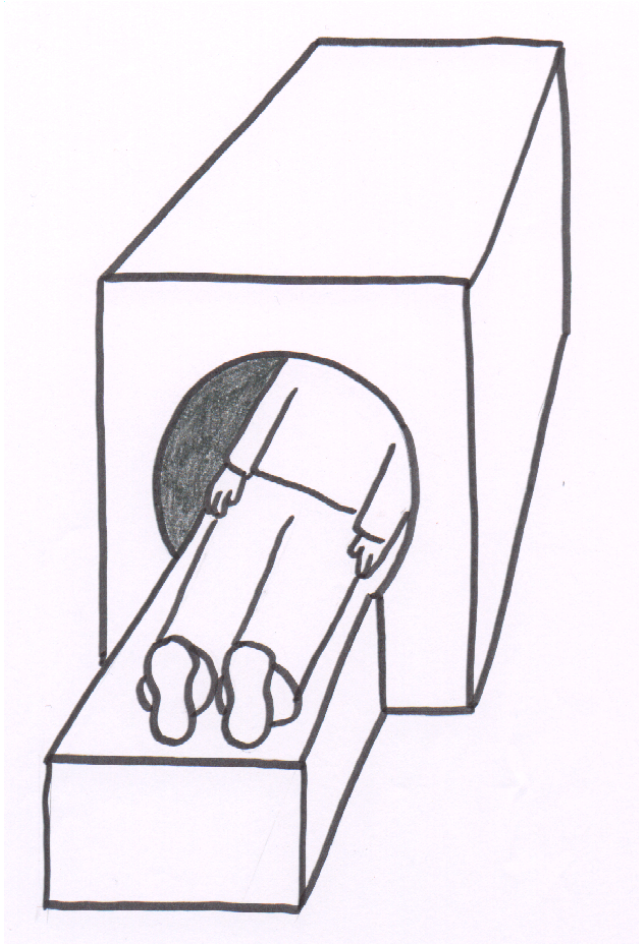

It is done in a hospital by a radiographer.

It is very noisy but does not hurt!

This leaflet tells you what might happen when you have an MRI scan of your brain.

- **About a week later the results will be sent to the doctor who will tell you what they mean.**

- The bench will move slowly through a hole into a tunnel.
- You will hear a loud banging noise. Don't be frightened, it won't hurt!

- It is important to relax. You must lie very still while you are in the tunnel so that the photographs are clear.

- The bench will move slowly out of the tunnel.
- This means your MRI scan has finished.
- The radiographer will help you up and say you can go.

- The radiographer will give you some earplugs and a special helmet to wear.
- You will be asked to lie down on a bench.
- A strap will be put around your head to keep it still.
